Under the Guidance of

Ms. Jyoti Chauhan/Rohit Sahu

SHETH L.U.J. AND SIR M.V. COLLEGE

Academic Year – 2026-27

GUIDE INTERACTION DIARY FORM

I, the undersigned **Ujala Raj bahadur Yadav**, Roll No. **T126**, studying in the **Third Year of B.Sc. Computer Science Full-Time Course**, am doing my project work under the guidance of **Ms. Jyoti Chauhan**. I wish to state that I have met my Internal Guide on the following dates mentioned below for Project Guidance for my project titled **"Digital Lost-and-Found for Public Spaces."**

UJALA YADAV

Signature of the Candidate

Signature of Internal Guide

DECLARATION

I, Ms. **Ujala Rajbahadur Yadav**, a student of Sheth L.U.J. and Sir M.V. College, studying in the Bachelor of Science in Computer Science programme, hereby declare that I am undertaking the project entitled **"Digital Lost-and-Found for Public Spaces"** during the academic year **2026–2027**.

The information and data included in this report will be based on the survey responses, project work, observations, and other sources used during the course of this project.

Due credit will be given to all sources of information and reference materials used in this project, as mentioned in the bibliography.

Date : _____

Ujala Yadav

ACKNOWLEDGEMENT

I would like to express my sincere gratitude to everyone who has supported and guided me throughout my project, **"Digital Lost-and-Found for Public Spaces."**

I am thankful to our Head of Department, **Dr. Mahendra Kanojia**, for providing the necessary academic support and encouragement for this project.

I would like to express my heartfelt gratitude to my project guide, **Ms. Jyoti Chauhan**, for her valuable guidance, suggestions, and support throughout the planning and development of this project.

I am also thankful to all the respondents who participated in my survey and shared their experiences and opinions regarding lost and found items in public places. Their responses helped me understand the challenges people face and identify useful features for the proposed website.

Finally, I would like to thank my college, **Sheth L.U.J. and Sir M.V. College**, for providing me with the opportunity to undertake this project and apply my computer science knowledge to a real-world problem.

ABSTRACT

The project titled **"Digital Lost-and-Found for Public Spaces"** aims to address the difficulties people face when they lose or find personal belongings in public places. Traditional methods of recovering lost items often involve contacting security staff, asking nearby people, or posting messages on social media, which may not always provide an effective solution.

The project involves studying existing lost-and-found practices and understanding users' needs through a survey. A total of 16 responses were collected using Google Forms to identify common problems and useful features for a digital solution.

Based on the survey findings, a website is proposed that will allow users to report lost and found items, browse and search item listings, view relevant details such as dates and locations, and follow safe communication practices. The website will be designed to provide a simple and accessible way to connect people who have lost items with those who have found them.

This project demonstrates the application of computer science concepts to a practical community problem. It aims to improve the organisation and accessibility of lost-and-found information in public spaces.

CHAPTER 1: INTRODUCTION

1.1 Introduction

In public places such as colleges, railway stations, buses, shopping areas, offices, and parks, people may accidentally lose personal belongings such as wallets, identity cards, mobile phones, keys, bags, and other important items. Similarly, people sometimes find belongings that have been left behind by others.

Currently, lost-and-found information is often managed through security staff, reception desks, notice boards, social media groups, or direct communication. These methods may make it difficult to connect the person who lost an item with the person who found it.

The project titled **"Digital Lost-and-Found for Public Spaces"** aims to study these challenges and develop a website that provides a central platform for reporting and searching for lost and found items.

The proposed website will allow users to submit details about lost or found belongings, browse available listings, and search using relevant information such as item category, date, and location. Safe communication practices will also be considered to protect users' privacy.

A survey was conducted using Google Forms, and 16 responses were collected to understand people's experiences and requirements. The findings will help guide the design and development of the website.

1.2 Problem Statement

People who lose personal belongings in public places may face difficulties locating them because information about lost and found items is scattered across different locations and communication channels. There may be no central system through which people can easily report, search for, and identify matching items.

Therefore, there is a need to design a simple digital platform that organises lost-and-found information and helps connect people who have lost items with those who have found them.

1.3 Objectives of the Project

The main objectives of this project are:

1. To study existing lost-and-found practices in public spaces.
2. To understand common problems through survey responses and appropriate observations.
3. To design and develop a user-friendly lost-and-found website.
4. To provide options for reporting lost and found items.
5. To enable users to browse, search, and filter item listings.
6. To display useful information such as item descriptions, dates, and locations.
7. To consider user privacy and safe communication.
8. To test the website and evaluate whether it meets the identified requirements.

1.4 Scope of the Project

The project focuses on designing a digital lost-and-found platform for public spaces such as educational institutions, societies, transport areas, and other community locations.

The proposed system will include:

- Forms for reporting lost and found items.
- A listing page for viewing reported items.
- Search and filter options.
- Relevant item details, including category, date, and location.
- Guidance for safe communication between users.
- An option to report suspicious or inappropriate listings.

The project will initially focus on the core website features that can be implemented and tested within the available project period. Any advanced features, such as user accounts, notifications, or a shared online database, may be considered for future development.

CHAPTER 2: LITERATURE REVIEW

2.1 Introduction

A literature review helps us understand existing systems, research, and technologies related to the selected project. The purpose of this chapter is to study existing methods of managing lost and found items and explore how computer-based systems can improve the process.

Lost-and-found systems are used in places such as colleges, shopping malls, transport facilities, offices, and other public spaces. Traditional methods often depend on manual registers, security desks, notice boards, and announcements. Digital systems can organise item information and make it easier for users to search for possible matches.

2.2 Existing Methods of Lost-and-Found Management

Traditionally, when a person loses an item, they may contact security staff, visit a reception desk, ask nearby people, or post information on social media. Similarly, a person who finds an item may hand it over to the relevant authority.

These methods are simple but may create difficulties when information is scattered across different locations. People may not know where to report an item, and it may be difficult to connect a lost-item report with a found-item report.

A centralised digital platform can organise reports in a common location and allow users to search using details such as item category, description, date, and location.

2.3 Review of Related Research

2.3.1 Lost and Found Management System

Karn and other researchers presented a web-based Lost and Found Management System in 2026. The system describes how users can report lost and found items by providing details such as category, description, date, and location. It also discusses search and matching techniques to identify possible connections between reports.

This research is relevant to the proposed project because it demonstrates how a website can organise lost-and-found information and simplify the search process.

2.3.2 LostNet: A Smart Way for Lost and Find

The research paper *LostNet: A Smart Way for Lost and Find*, published in 2024, explores the use of image-matching techniques to compare photographs of lost and recovered items. It discusses how computer vision can help identify possible matches between item reports.

This study provides an example of how advanced technology could improve item identification. However, image recognition is beyond the initial scope of our basic website and may be considered for future development.

2.3.3 Find-It Mall: A Web-Based Lost and Found Management System

The study *Find-It Mall: A Web-Based Lost and Found Management System for Malaysian Retail Environments*, published in 2025, describes a digital platform for managing lost and found items in commercial environments. It discusses features such as item reporting, claim management, staff administration, and email notifications.

This research highlights the value of a centralised platform for organising reports and improving communication between users and the staff responsible for lost property.

2.4 Critical Analysis

The reviewed research shows that digital platforms can provide a structured way to record, organise, and search for lost and found items. Common features include item reporting, searchable listings, item categories, date and location details, and communication facilities.

Advanced systems may also use image recognition, automated matching, authentication, and notifications.

CHAPTER 3: METHODOLOGY

3.1 Introduction

Methodology describes the systematic approach followed to understand the problem, collect information, plan the solution, develop the website, and test its functionality.

The methodology for the project titled “Digital Lost-and-Found for Public Spaces” includes survey preparation, data collection, analysis of user requirements, system planning, website development, and testing.

3.2 Project Approach

The project follows a user-oriented approach in which the requirements of people who lose or find belongings are considered before developing the website.

The main stages of the project are:

1. **Problem Identification:** Understanding the difficulties people face when reporting and recovering lost belongings.
2. **Survey Preparation:** Creating a questionnaire using Google Forms to collect information about users' experiences and requirements.
3. **Data Collection:** Collecting survey responses from willing participants.
4. **Data Analysis:** Examining the responses to identify common problems and useful website features.
5. **System Planning:** Identifying the main users, system requirements, and website functions.
6. **Website Development:** Building the website according to the identified requirements.
7. **Testing and Evaluation:** Checking the website's functions and correcting errors.

3.3 Tools and Technologies

The following tools and technologies are planned for the project. The final list will be updated according to the tools actually used.

Tool / Technology	Purpose
Google Forms	Creating the survey questionnaire
Google Sheets	Organising and analysing survey responses
HTML	Creating the website structure
CSS	Designing the website appearance
JavaScript	Implementing interactive features
Visual Studio Code	Writing and editing website code
Web Browser	Running and testing the website

3.4 Data Collection Method

A questionnaire was prepared using Google Forms to understand people's experiences with lost and found items in public places.

The questionnaire included questions about respondents' backgrounds, experiences of losing or finding belongings, common locations where items are lost, difficulties in recovering items, willingness to use a digital platform, and useful website features.

A total of **16 survey responses** have been collected. These responses will be analysed to identify common requirements for the proposed website.

3.5 System Development Method

The website will be developed in stages, beginning with the user interface and the basic reporting and searching features. Additional functions will be implemented and tested as development progresses.

The proposed development stages are:

- Designing the homepage and navigation.
- Creating forms for reporting lost and found items.
- Displaying item listings.

- Implementing search and filtering.
- Displaying item details such as category, date, and location.
- Adding guidance for safe communication and suspicious-listing reporting.
- Testing the website and recording the results.

3.6 Testing Method

Testing will be carried out to check whether the website works as expected. The main functions to be tested include form validation, submission of item details, display of listings, searching, filtering, and handling of incorrect or incomplete inputs.

The results of the tests will be recorded after the corresponding features have been implemented. Any errors found during testing will be corrected where possible.

3.7 Summary

The methodology provides a structured plan for completing the project, from identifying user needs to developing and testing the proposed website. The survey responses will guide the design, while the development and testing stages will help evaluate whether the final system meets its intended objectives.

CHAPTER 4: SURVEY ANALYSIS AND INTERPRETATION

4.1 Introduction

A survey was conducted using Google Forms to understand people's experiences with lost and found items in public places. The purpose was to identify common difficulties in recovering lost belongings and determine the features users would find useful in a digital lost-and-found system.

A total of 20 responses were recorded in the latest survey dataset. The responses were examined to identify common patterns and requirements for the proposed website. Some questions contain blank responses or multiple selections, which are considered during interpretation.

4.2 Respondent Categories

The survey included college students, working professionals, and teachers or college staff.

Category	Selections
College students	11
Working professionals	5
Teachers or college staff	3

The results show that college students formed the largest respondent group. The survey therefore provides useful initial feedback from students and other participants.

4.3 Experience of Losing or Finding Items

4.3.1 Experience of Losing Items

Response	Selections
Yes	11
No	7

The responses indicate that more participants selected “Yes” than “No” when asked whether they had lost an item in a public place. One response selected both options, so the totals represent selections rather than unique respondents.

4.3.2 Experience of Finding Items

Response	Selections
Yes	9
No	6

Several respondents reported having found an item belonging to someone else. This highlights the importance of providing a way to report recovered belongings.

4.4 Common Locations for Lost and Found Items

Location	Selections
Shopping area or market	6
College or school	6
Public transport	5
Park or public place	2
Office or workplace	1

Shopping areas, markets, and educational institutions received the highest number of selections. These locations may be considered when planning the website's location field and search options.

4.5 Willingness to Use a Digital Platform

Response	Selections
Definitely	8
Probably	1
Not sure	5
Probably not	3
Definitely not	1

Eight respondents selected “Definitely,” while five were unsure. This suggests that there is some interest in a digital lost-and-found website, although acceptance is not universal.

4.6 Useful Website Features

Feature	Selections
Report a lost item	8
Search and filter listings	5
Contact the other person safely	5
Report a found item	5
View the date and location	4
Report suspicious listings	3

Reporting lost items received the highest number of selections. Searching listings, reporting found items, and safe communication were also selected by respondents. These findings will help prioritise the website's main functions.

4.7 Common Actions and Difficulties

Actions taken when an item is lost

Action	Selections
Ask security staff or nearby people	7
Contact the place where it was lost	6
Post on social media or a group	4
Search the area	4

These responses show that people currently rely on several different methods to recover their belongings.

Difficulties in recovering items

Difficulty	Selections
No central place to report it	8
Cannot contact the finder or owner	6
Do not know where to search	5
Concern about false claims or scams	3

The absence of a central reporting platform was the most frequently selected difficulty. Communication and search-related problems were also identified.

4.8 Major Findings

Based on the survey responses, the following findings were identified:

1. College students formed the largest respondent category.
2. Shopping areas and educational institutions were frequently selected as locations where items may be lost or found.
3. Respondents identified the lack of a central reporting platform as an important difficulty.
4. Reporting lost items was the most frequently selected website feature.
5. Search and filtering, reporting found items, and safe communication were also useful features identified by respondents.
6. Responses showed varying levels of willingness to use a digital platform.

4.9 Conclusion

The survey provided initial information about people's experiences and expectations regarding lost-and-found services. The findings support designing a website that organises lost and found reports, allows users to search for items, displays relevant dates and locations, and promotes safe communication.

The survey consisted of 20 recorded responses. Some questions had blank answers or multiple selections, so the results are interpreted as selections rather than assuming every question was answered by all 20 respondents.

CHAPTER 5: SYSTEM PLANNING AND DESIGN

5.1 Introduction

System planning and design is an important stage of software development. It helps identify the requirements, users, functions, and structure of the proposed system before implementation.

The project titled “Digital Lost-and-Found for Public Spaces” aims to provide a central website where users can report lost and found belongings and search existing reports. The system design is based on the project objectives and the requirements identified through the survey.

5.2 Proposed System

The proposed system is a web-based platform designed to organise information about lost and found items in public places. Users will be able to submit item details, view available listings, and search for potentially matching belongings.

The website will focus on a simple interface so that users can navigate the main functions easily. Item information will include details such as the item name, category, description, date, and location.

The initial version will focus on essential reporting and searching features. More advanced functions may be considered in future versions.

5.3 Stakeholders

The main stakeholders of the proposed system are:

1. **People who have lost items:** They can report missing belongings and search existing listings.
2. **People who have found items:** They can report recovered belongings to help identify the owners.
3. **Community members:** Students, staff, residents, and other users may benefit from the shared information.
4. **System administrator or moderator:** In a future or extended version, an administrator may review suspicious reports and manage inappropriate listings.

5. **Project developer:** The developer is responsible for designing, implementing, testing, and documenting the website.

5.4 Functional Requirements

The functional requirements describe what the website should do.

- **Report Lost Item:** Allow users to enter information about an item they have lost.
- **Report Found Item:** Allow users to submit information about an item they have found.
- **View Listings:** Display the available lost-and-found reports.
- **Search Items:** Allow users to search for items using relevant keywords.
- **Filter Listings:** Allow users to narrow results by available categories or other item details.
- **Display Item Information:** Show relevant details such as description, date, and location.
- **Safe Communication Guidance:** Explain how users can contact others without unnecessarily sharing personal information.
- **Suspicious Listing Reporting:** Provide a way to flag suspicious listings, subject to the capabilities implemented in the final version.

5.5 Non-Functional Requirements

The non-functional requirements describe the expected quality of the system.

1. **Usability:** The website should be simple to understand and navigate.
2. **Performance:** Pages and basic search functions should respond within a reasonable time.
3. **Compatibility:** The interface should work in commonly used modern web browsers.
4. **Maintainability:** The code should be organised so that changes and improvements can be made easily.
5. **Privacy:** The website should avoid displaying unnecessary personal information.

6. **Reliability:** Form inputs should be validated to reduce incomplete or incorrect reports.

5.6 Hardware and Software Requirements

Hardware Requirements

- Computer or laptop for development.
- Smartphone, tablet, or computer for accessing the website.
- Internet connection for online tools and deployment, where required.

Software Requirements

Software / Technology	Purpose
Windows or another compatible operating system	Development environment
Visual Studio Code	Writing and editing code
HTML	Website structure
CSS	Website styling
JavaScript	Website interaction
Google Chrome or another modern browser	Running and testing the website
Google Forms and Google Sheets	Survey collection and analysis

5.7 Proposed System Workflow

The proposed website will follow this general workflow:

1. The user opens the website.
2. The user chooses to report a lost item, report a found item, or search existing listings.
3. If reporting an item, the user enters the required information in a form.
4. The website validates the entered information.

5. The item report is saved using the storage method implemented in the system.
6. Users can browse or search the available listings.
7. Users review the details and follow the provided safe communication guidance if a possible match is found.

The final workflow will be updated to match the actual implementation.

5.8 Limitations of the Proposed System

The initial version will focus on basic lost-and-found reporting and searching. Unless additional functionality is implemented, the system may not include verified user accounts, automatic matching, real-time notifications, or a fully moderated database.

The reliability of a report also depends on the accuracy of the information entered by users. Users should verify ownership before returning an item, and sensitive information should not be displayed publicly.

5.9 Summary

This chapter defines the proposed system, its stakeholders, requirements, workflow, and limitations. The design provides a foundation for website development and testing. The next stage is to implement the planned features and verify that they work as intended.

CHAPTER 6: WEBSITE IMPLEMENTATION AND TESTING

6.1 Introduction

The Digital Lost-and-Found for Public Spaces project was developed to provide a simple and user-friendly platform for reporting and searching for lost and found items. The website helps users view item listings, search for belongings, and submit reports containing item details, dates, and locations.

The current version is a front-end website prototype developed using HTML, CSS, and JavaScript. It was opened and tested in a web browser to check its main features and functionality.

6.2 Technologies Used

The following technologies were used to develop the website:

1. **HTML:** Used to create the structure of the website, including the homepage, item listings, forms, and details sections.
2. **CSS:** Used to design the website layout, colours, typography, buttons, item cards, and responsive interface.
3. **JavaScript:** Used to implement interactive features such as searching, filtering, opening forms, displaying item details, and saving reports in the browser.
4. **Web Browser:** Used to run and test the website.

6.3 Website Modules

The website consists of the following modules:

1. Homepage

The homepage introduces the Digital Lost-and-Found system and provides options to report a lost item or a found item. It also displays summary counts and sample item listings.

2. Search and Filter Module

Users can search for items by entering keywords. They can also filter listings by item type, such as lost or found, and by category.

3. Report Lost Item Module

This module allows users to submit details of a lost item, including its name, category, date, location, description, contact name, and contact method.

4. Report Found Item Module

This module allows users to report an item they have found by entering its relevant details through the report form.

5. Item Details Module

Users can select an item listing to view additional information, including its description, category, date, location, and contact instructions.

6. Browser Storage Module

JavaScript and browser local storage are used to save submitted reports in the same browser. The saved reports can be displayed again when the website is reopened in that browser.

6.4 Website Workflow

The basic workflow of the website is as follows:

1. The user opens the website in a web browser.
2. The user views the available lost and found listings.
3. The user searches for an item or applies filters.
4. The user opens the report form if an item needs to be reported.
5. The user enters the required item information and submits the form.
6. The submitted report is added to the website and saved in the current browser.
7. Users can open a listing to view its details and contact instructions.

6.5 Testing and Results

The website was tested manually in a web browser to verify the main interactive features.

Test Case	Expected Result	Status
Open the homepage	Homepage and sample listings are displayed	Passed
Open the lost-item form	The report form opens	Passed
Close the form using Cancel	The form closes	Passed
Search for an item	Matching listings are displayed	Passed
Open item details	Additional item information is displayed	Passed

The above tests were performed on the current prototype. Additional testing should be carried out whenever new features are added.

6.6 Limitations of the Current System

The current version has the following limitations:

1. The reports are stored only in the user's current browser.
2. Reports are not shared automatically between different users or devices.
3. The website does not yet have a connected server-side database.
4. User registration, login, and an administrative dashboard have not been implemented.
5. Contact instructions are displayed, but the website does not send messages or notifications automatically.
6. The sample listings are demonstration data and should not be treated as actual lost-and-found reports.

6.7 Summary

The current prototype demonstrates the basic concept of a Digital Lost-and-Found system. It provides a homepage, reporting forms, search and filtering, item details, and browser-based storage. Manual testing confirmed that the main features listed above worked during testing. The system can be improved further by adding a shared database, user authentication, administrative controls, and secure communication features.

CHAPTER 7: CONCLUSION AND FUTURE SCOPE

7.1 Conclusion

The project titled **"Digital Lost-and-Found for Public Spaces"** aims to make it easier for people to report and search for lost and found belongings. Losing personal items in places such as colleges, public transport areas, markets, and other public spaces can cause inconvenience. A digital platform can help organize item information and make it easier for people to find relevant reports.

As part of this project, a website prototype was developed using HTML, CSS, and JavaScript. The website includes a homepage, lost and found reporting forms, item listings, search and filtering options, item details, and browser-based storage. The main interactive features were manually tested in a web browser.

The survey conducted for the project also helped identify common difficulties associated with lost-and-found practices and features that respondents considered useful.

The current prototype demonstrates the basic working concept of the proposed system. However, it is not yet a complete multi-user platform because reports are stored only in the current browser and are not shared through a central database.

Overall, the project provided practical experience in website development, user-interface design, form handling, data presentation, testing, and understanding a real-world community problem.

7.2 Future Scope

The project can be improved in the following ways:

1. Database Integration

A shared database can be added to store item reports centrally so that users on different devices can view the same information.

2. User Registration and Login

User accounts can be introduced to help users manage their reports and provide additional control over access.

3. Automatic Item Matching

The system can compare item categories, descriptions, dates, and locations to suggest possible matches between lost and found reports.

4. Image Uploads

Users can upload photographs of items to help identify belongings more easily. Sensitive information should be hidden where necessary.

5. Secure Communication

A safer communication system can be introduced so that users can contact one another without publicly displaying personal contact details.

6. Administrator Dashboard

An administrator can review reports, remove suspicious listings, and manage inappropriate or duplicate submissions.

7. Notifications

Email or in-website notifications can inform users when a potentially matching item is reported.

8. Online Deployment

The website can be deployed on a suitable hosting platform so that people can access it through a public link.

9. Improved Security and Privacy

Future versions can include input validation, access controls, spam prevention, and privacy safeguards to protect users and their information.

7.3 Final Remarks

The Digital Lost-and-Found for Public Spaces project is a practical application of web development to a community problem. The current prototype establishes the foundation for a more complete system. With further development, testing, and database integration, it has the potential to become a more accessible and useful platform for connecting people with their lost belongings.

Student Feedback on CEP

Student Name: Ujala Raj bahadur Yadav
Seat No. / Roll No.: T126
Email: yujala777@gmail.com
Department: Computer Science
Name of the Mentor: Ms. Jyoti Chauhan

Title of Field Project: Digital Lost-and-Found for Public Spaces

Brief description of FP carried out: The field project focuses on understanding the problems faced by people who lose or find items in public spaces. A survey was conducted to understand existing practices and user needs. Based on the findings, a website prototype was developed to allow users to report lost and found items and browse available listings.

Indicate the degree to which you agree or disagree with the following statements.

This experience has:	Response
Given me the opportunity to explore a career field	Strongly Agree
Allowed me to apply classroom theory to practice	Strongly Agree
Helped me develop my decision-making and problem-solving skills	Strongly Agree
Expanded my knowledge about the work world before permanent employment	Agree
Helped me develop my written and oral communication skills	Agree
Provided a chance to use leadership skills	Agree
Expanded my sensitivity to the ethical implications of the work involved	Strongly Agree
Made it possible for me to be more confident in new situations	Agree

Given me a chance to improve my interpersonal skills	Agree
Helped me learn to handle responsibility and use my time wisely	Strongly Agree
Helped me discover new aspects of myself that I didn't know existed before	Agree
Helped me develop new interests and abilities	Strongly Agree
Helped me clarify my career goals	Agree
Allowed me to acquire information and/or use equipment not available at my institute	Agree
Allowed me to realize socio-economic issues in society	Strongly Agree

1. In the Institute CEP program, faculty members are expected to be mentors for students. Do you feel that your faculty mentor served such a function? Why or why not?

Yes, my faculty mentor provided guidance and support throughout the project. The guidance helped me understand the project requirements, plan the website, and improve the documentation.

2. How well were you able to accomplish the initial goals, tasks and new skills that were set down in your learning contract? In what ways were you able to take a new direction or expand beyond your contract? Why were some goals not accomplished adequately?

I was able to work towards the main goals of the project by conducting a survey, analysing responses, planning the system, and developing a website prototype. Some advanced features, such as a shared database and automatic matching, remain part of the future scope because of time and resource limitations**.**

3. In what areas did you most develop and improve?

I improved my skills in website development, HTML, CSS, JavaScript, survey analysis, problem-solving, and project documentation.

4. What has been the most significant accomplishment / satisfying moment of your CEP?

The most satisfying part of my CEP was developing the website prototype and seeing how a digital platform could help people report and search for lost and found items.

5. What did you dislike about the CEP?

One challenge was managing the time required for survey analysis, website development, testing, and documentation alongside my academic responsibilities.

6. Considering your overall experience, how would you rate this CEP? (Circle one). – Satisfactory / Good / Excellent

Good

7. Give suggestions as to how your CEP experience could have been improved. (Could you have handled added responsibility? Would you have liked more discussions with your professor concerning your CEP? Was closer supervision needed? Was more of an orientation required?)

The CEP experience could have been improved through more structured guidance sessions, regular feedback from the mentor, and additional time for website testing and implementation.
